

CS 3205 COMPUTER NETWORKS

JAN-MAY 2020

LECTURE 9: 6TH FEB 2020

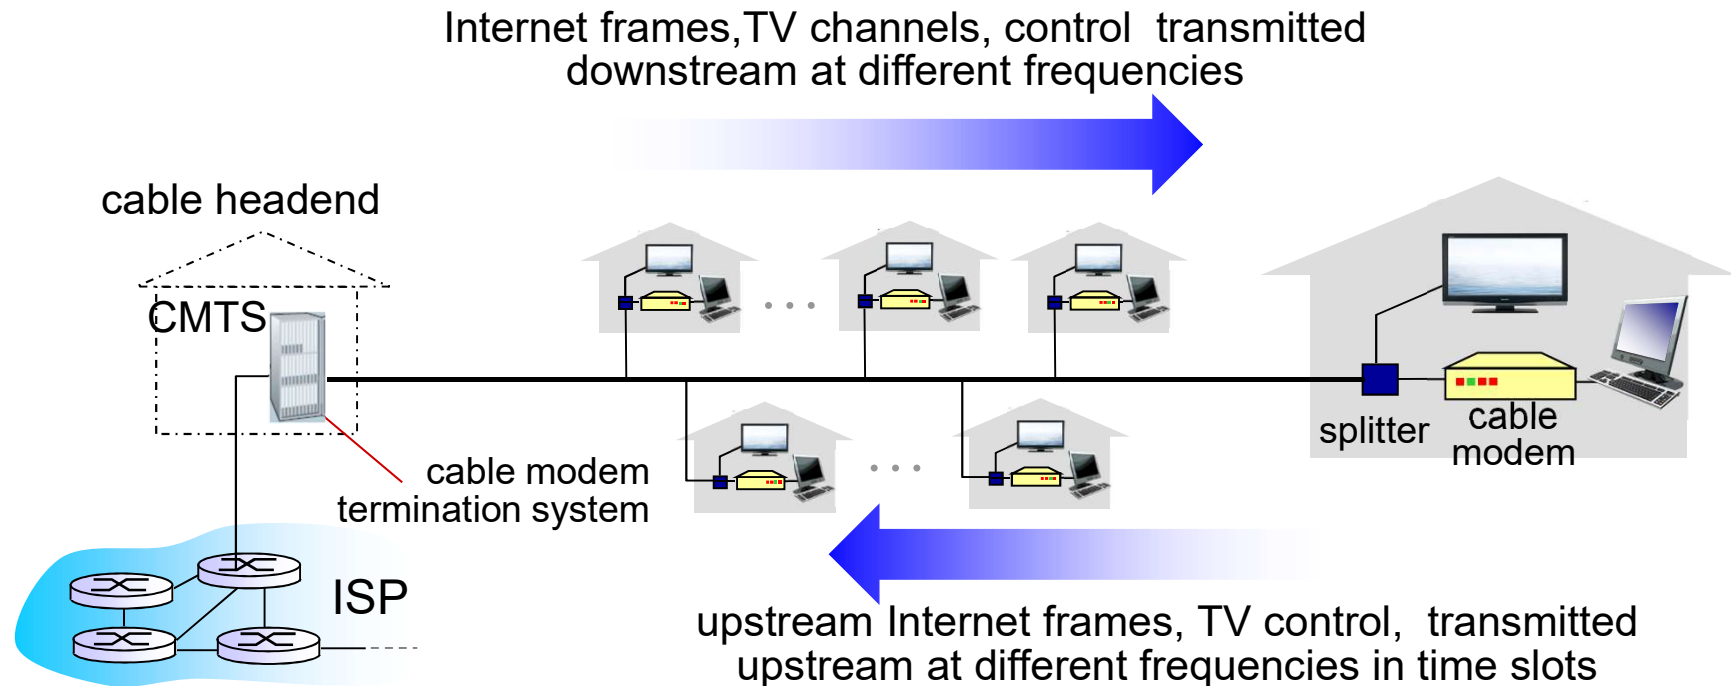

Text book and section(s) covered in this lecture:
Book Kurose and Ross – Sections 5.3, 5.4

Cable networks

Section 5.3.4

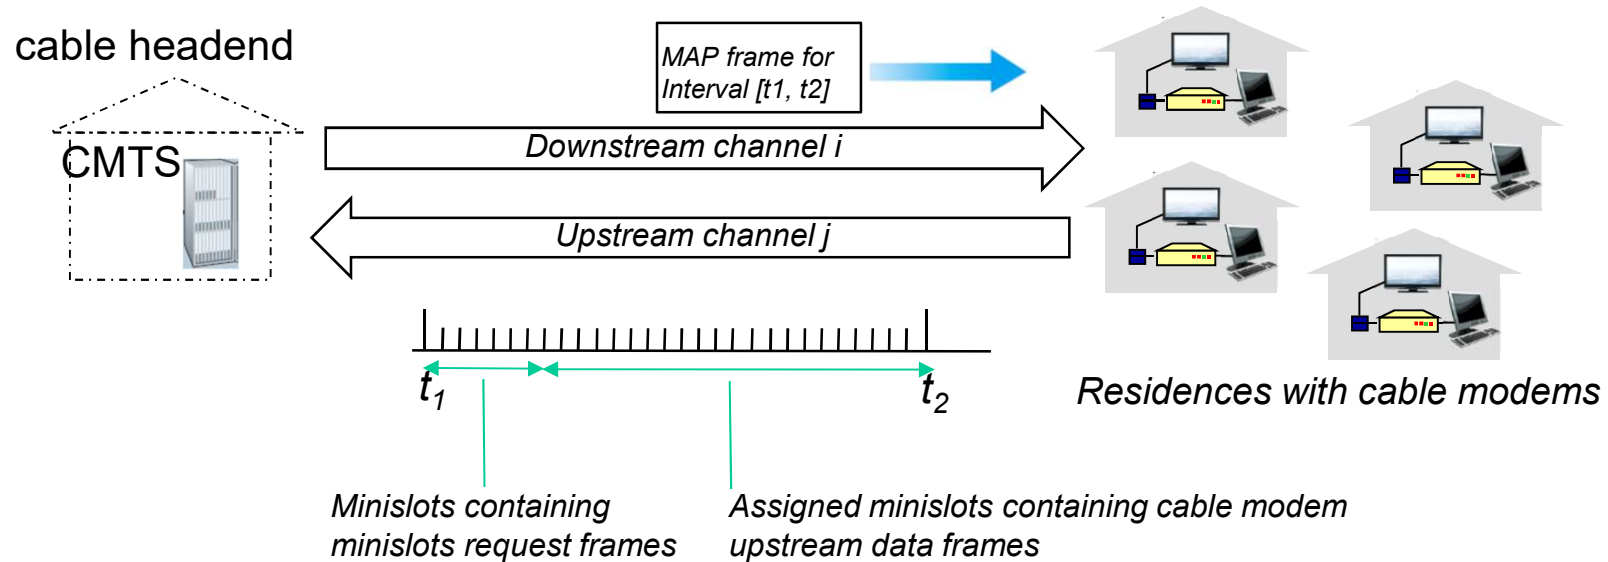

Cable access network

Data-Over-Cable Service Interface Specification (DOCSIS)

- ❖ **multiple** 40Mbps downstream (broadcast) channels – FDM used
 - single CMTS transmits into channels – no multi access problem
- ❖ **multiple** 30 Mbps upstream channels – FDM
 - **multiple access:** all users contend for certain upstream channel time slots (others assigned) – TDM within a channel.

Cable access network

DOCSIS: data over cable service interface spec

- ❖ FDM over upstream, downstream frequency channels
- ❖ TDM upstream: some slots assigned, some have contention
 - downstream MAP frame: assigns upstream slots
 - request for upstream slots (and data) transmitted random access (binary backoff) in selected slots

ARP – some additional aspects

Section 5.4.1

A typical ARP Table

Internet Address	Physical Address	Type
169.254.19.59	a4-93-4c-dd-a7-cd	dynamic
172.30.61.129	a4-93-4c-dd-a7-cd	dynamic
172.30.61.255	ff-ff-ff-ff-ff-ff	static
224.0.0.22	01-00-5e-00-00-16	static
224.0.0.251	01-00-5e-00-00-fb	static
224.0.0.252	01-00-5e-00-00-fc	static
239.255.255.250	01-00-5e-7f-ff-fa	static
255.255.255.255	ff-ff-ff-ff-ff-ff	static

- ❖ Address 224.0.0.22 – IGMPv3 protocol
- ❖ Address 224.0.0.251 – Multicast DNS
- ❖ Address 224.0.0.252 – Link local multicast name resolution protocol (LLMNR)
- ❖ Address 239.255.255.250 – Simple Service Discovery Protocol – A protocol for advertise and discovery of network services and presence information.
- ❖ Address 255.255.255.255 – Broadcast to all nodes in that network
- ❖ STATIC address type are fixed. They don't need ARP. ARP is used for addresses, which are dynamic

ARP Wireshark – check / Demo

Link Layer - Ethernet

Section 5.4.2

Ethernet

“dominant” wired LAN technology:

- ❖ cheap \$20 for NIC
- ❖ first widely used LAN technology
- ❖ simpler, cheaper than token LANs and ATM
- ❖ kept up with speed race: 10 Mbps – 10 Gbps

Metcalfe's Ethernet sketch

Ethernet: physical topology

- ❖ *bus*: popular through mid 90s
 - all nodes in same collision domain (can collide with each other)
- ❖ *star*: prevails today
 - active *switch* in center
 - each “spoke” runs a (separate) Ethernet protocol (nodes do not collide with each other)

bus: coaxial cable

Ethernet frame structure

sending adapter encapsulates IP datagram (or other network layer protocol packet) in **Ethernet frame**

preamble:

- ❖ 7 bytes with pattern 10101010 followed by one byte with pattern 10101011
- ❖ used to synchronize receiver, sender clock rates

Ethernet frame structure (more)

- ❖ **addresses:** 6 byte source, destination MAC addresses
 - if adapter receives frame with matching destination address, or with broadcast address (e.g. ARP packet), it passes data in frame to network layer protocol
 - otherwise, adapter discards frame
- ❖ **type:** indicates higher layer protocol (mostly IP but others possible, e.g., Novell IPX, AppleTalk)
- ❖ **CRC:** cyclic redundancy check at receiver
 - error detected: frame is dropped

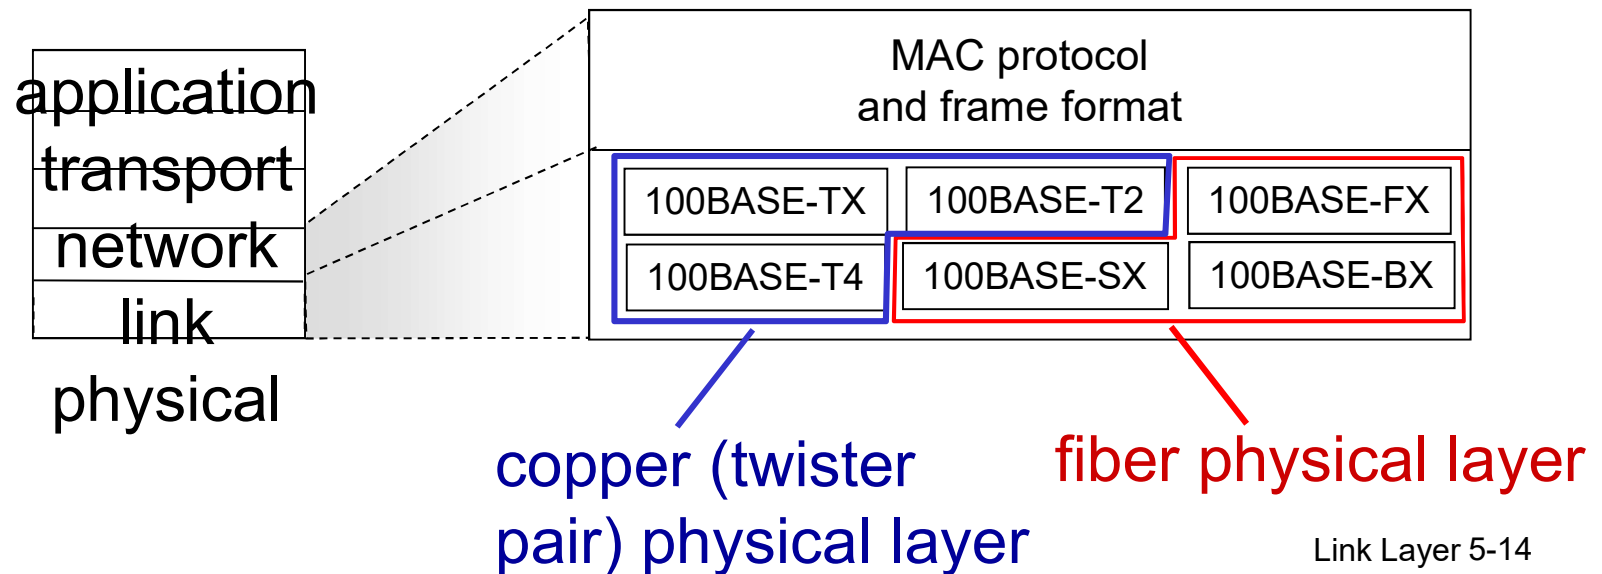

Ethernet: unreliable, connectionless

- ❖ *connectionless*: no handshaking between sending and receiving NICs
- ❖ *unreliable*: receiving NIC doesn't send acks or nacks to sending NIC
 - data in dropped frames recovered only if initial sender uses higher layer rdt (e.g., TCP), otherwise dropped data lost
- ❖ Ethernet's MAC protocol: unslotted *CSMA/CD with binary backoff*

802.3 Ethernet standards: link & physical layers

❖ *many* different Ethernet standards

- common MAC protocol and frame format
- different speeds: 2 Mbps, 10 Mbps, 100 Mbps, 1 Gbps, 10G bps
- different physical layer media: fiber, cable

Link layer, LANs: outline

5.1 introduction, services

5.2 error detection,
correction

5.3 multiple access
protocols

5.4 LANs

- addressing, ARP
- Ethernet
- switches
- VLANs

5.5 link virtualization:
MPLS

5.6 data center
networking

5.7 a day in the life of a
web request

Link Layer Switches

Section 5.4.3

Ethernet switch

- ❖ link-layer device: takes an *active* role
 - store, forward Ethernet frames
 - examine incoming frame's MAC address, *selectively* forward frame to one-or-more outgoing links when frame is to be forwarded on segment, uses CSMA/CD to access segment
- ❖ *transparent*
 - hosts are unaware of presence of switches
- ❖ *plug-and-play, self-learning*
 - switches do not need to be configured

Switch: *multiple* simultaneous transmissions

- ❖ hosts have dedicated, direct connection to switch
- ❖ switches buffer packets
- ❖ Ethernet protocol used on *each* incoming link, but no collisions; full duplex
 - each link is its own collision domain
- ❖ **switching**: A-to-A' and B-to-B' can transmit simultaneously, without collisions

*switch with six interfaces
(1,2,3,4,5,6)*

Switch forwarding table

Q: how does switch know A' reachable via interface 4, B' reachable via interface 5?

- ❖ A: each switch has a **switch table**, each entry:
- (MAC address of host, interface to reach host, time stamp)
 - looks like a routing table!

Q: how are entries created, maintained in switch table?

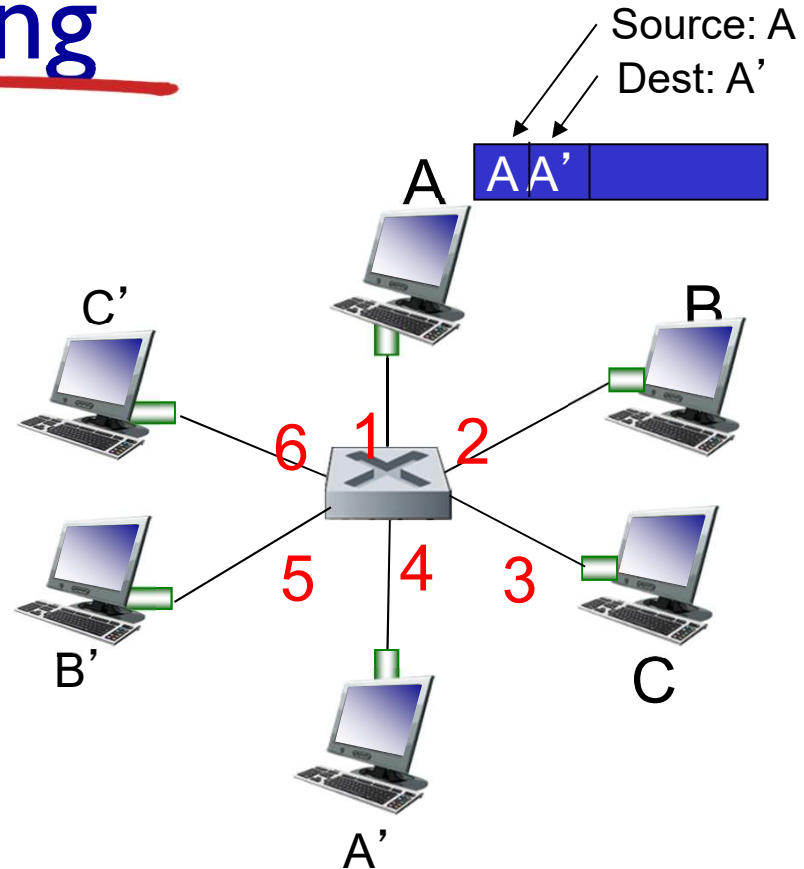

- something like a routing protocol?

*switch with six interfaces
(1,2,3,4,5,6)*

Switch: self-learning

- ❖ switch *learns* which hosts can be reached through which interfaces
 - when frame received, switch “learns” location of sender: incoming LAN segment
 - records sender/location pair in switch table

MAC addr	interface	TTL
A	1	60

*Switch table
(initially empty)*

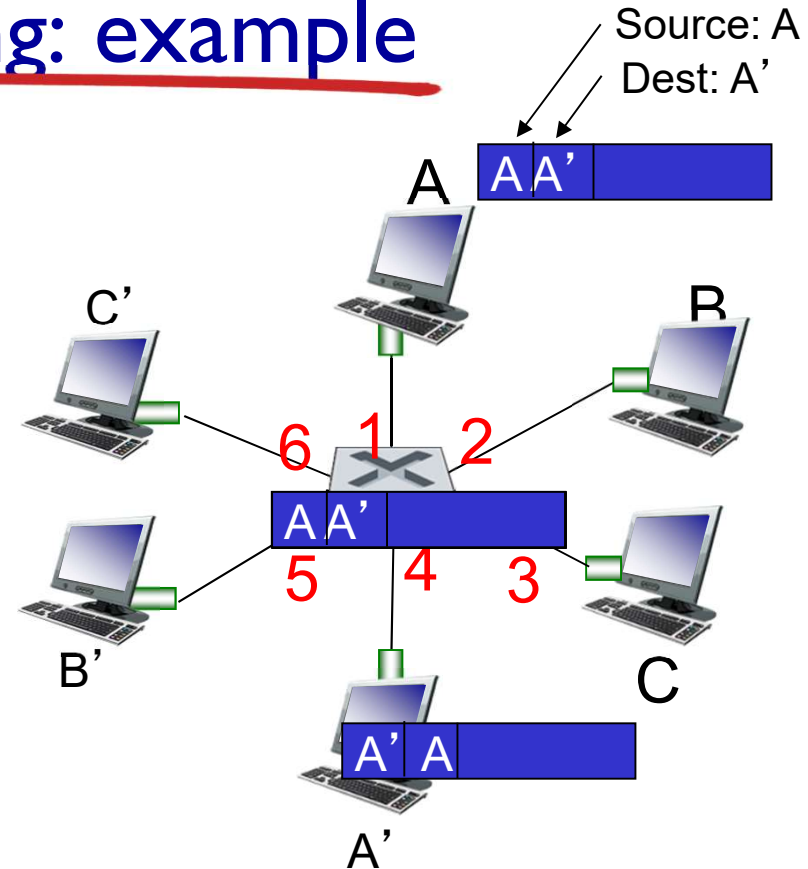

Switch: frame filtering/forwarding

when frame received at switch:

1. record incoming link, MAC address of sending host
2. index switch table using MAC destination address
3. if entry found for destination
 then {
 if destination on segment from which frame arrived
 then drop frame
 else forward frame on interface indicated by entry
 }
 else flood /* forward on all interfaces except arriving
 interface */

Self-learning, forwarding: example

- ❖ frame destination, A', location unknown: *flood*
- ❖ destination A location known: *selectively send on just one link*

MAC addr	interface	TTL
A	1	59
A'	4	60

*switch table
(initially empty)*

Interconnecting switches

- ❖ switches can be connected together

Q: sending from A to G - how does S_1 know to forward frame destined to F via S_4 and S_3 ?

- ❖ **A:** self learning! (works exactly the same as in single-switch case!)

Self-learning multi-switch example

Suppose C sends frame to I, I responds to C

- ❖ Q: show switch tables and packet forwarding in S₁, S₂, S₃, S₄

Institutional network
